

ABSTRACT OF THE DISCLOSURE

A method and apparatus wherein a plurality of functions are implemented on a multimedia presentation device. A user can access several of the functions by depressing a single button. A particular function is specified by the duration of the button depression. For one embodiment the functions affect a favorite program list and allow a user to access the list, update the list, and delete entries from the list depending upon button depression duration. For example, the user may depress button number (#) 3 of a remote control device. A brief depression (e.g., less than 1 second), results in the remote control interpreting this click as a digit for selecting a channel, and the system will tune to channel #3. A longer depression (e.g., between 1 and 2 seconds), results in the system recalling previously programmed selection #3. Likewise, other functions are implemented by depressing the button for various durations.
